“In cosmetic plastic surgery, good information is essential to making a good informed decision. My goal at every consultation is to first learn exactly what it is that concerns you about your appearance. It takes time for me to get to know you and understand your needs. Only then can I thoughtfully consider your unique situation and be able to offer options specific to your goals.

“My greatest joy in plastic surgery is seeing a patient after surgery and sharing their excitement from a great result. I am fortunate to have chosen a career which blends my technical and scientific strengths with my artistic passion and allows me to help people in profound ways. My commitment to excellence drives me to provide the best customized result possible for each patient.”

FOR
smoother, healthier,
more vibrant skin.

You Can
Look Your Best.

 SCITON® | CONTOUR™

MICROLASERPEEL™

*N*ow you can have younger looking, healthier feeling skin with a popular new treatment – the Contour™ MicroLaserPeel™.

Does this sound like you?

"I've always been active. Years ago I was unaware of the effects of sun and wind on my skin. Although I don't feel as old as I sometimes look I'm not ready for surgery or a long recovery process, but I'd love to look as young as I feel!"

The "weekend" skin peel, the MicroLaserPeel, treats skin conditions associated with aging and an active lifestyle. You can see real improvements in just a few days.

Your physician can advise you on how best to protect your skin to maintain the benefits you will see from your MicroLaserPeel, and can answer any question you might have after you read this brochure.

Answers to your Questions

What is the MicroLaserPeel?

It is an intra-epidermal laser peel that precisely ablates the outermost layers of the skin. The procedure is individually tailored to the nature of the condition to be corrected.

Skin conditions such as: wrinkles, scars, acne scars, keratoses, or pigmentary problems have been very successfully treated with a MicroLaserPeel.

Who Should Consider a MicroLaserPeel?

If you are looking for more than microdermabrasion or light chemical peels, and have little time for a prolonged healing process, then the MicroLaserPeel was designed for you.

How is the MicroLaserPeel different from Microdermabrasion?

Generally, microdermabrasion only removes the stratum corneum (10 microns).

The MicroLaserPeel is a partial- to-full epidermal peel (20-50 microns) and is performed with topical anesthetic. Because this procedure ablates deeper into the epidermis, it is the perfect step between microdermabrasion and full skin resurfacing.

How many MicroLaserPeels can be done?

Typically, the procedure is repeated 2-4 times, spaced 6-8 weeks apart, but many peels may be done to achieve the desired result.

What can you expect?

You will experience smoother, healthier, more vibrant skin, with a significant, immediate change in skin texture and tightness as compared to microdermabrasion.

How long is the healing process?

Healing takes 3-4 days. The procedure can be performed on a Thursday or Friday, so you can return to work the following Monday. Symptoms immediately following the procedure resemble a sunburn, with minor sloughing on the second day. Redness will begin to fade by the third day, and be easily covered by makeup on the fourth day.

What should I know about pre- and post-treatment care?

Your physician will provide you with very detailed pre- and post-treatment information.
